Chlamydia Screening

Who should get tested?
- All sexually active men and women, especially under the age of 26
- Anyone older than age 26 who is sexually active and has changed partners or has multiple partners

Why is it important to be screened?
- The majority (75%) of women and 50% of men who have chlamydia don’t have any symptoms.
- It’s treatable! If left untreated, it can silently cause deep pelvic infections in women and is a major cause of infertility and chronic pelvic pain.
- Try to get tested at least once a year as long as you are sexually active, and more than once a year if you have a change in partners or if your partner has not been monogamous.

No examination is necessary UNLESS you have any of the following symptoms*:
- Burning with urination
- Pelvic pain (for women)
- Vaginal discharge or discomfort (for women)
- Urethral discharge (for men)
- Other undiagnosed genital symptoms

*If you have any of the above symptoms, please make an appointment with a health care provider at Student Health Service

How does the screening work?
You can make a positive step to test yourself for the #1 bacterial STI (sexually transmitted infection). And it’s so easy to do with a simple urine test.
- Schedule an appointment at Student Health Service by calling (414) 288-7184, or online at https://student-health.mu.edu/PyramedPortal
- Do not urinate for at least one hour prior to giving the urine sample
- Urinate directly into the sample cup
- You will receive a phone call with your lab result
- Privacy is maintained throughout the testing process
