Converting Files for Final Cut Pro

Final Cut Pro can “read” most common audio (.mp3, .aiff) and video (.mov, .mov4, .avi) file types, but it operates best if the video files are converted using the compression codec that is native to the program (Apple ProRes 422). The Media Studio Mac has a Batch Droplet application that can convert your files using this codec. Doing so will reduce your render times and prevent program failures.

(1) First, find the Batch Droplet in the Applications Folder.

(2) Open the program. The main screen will look as follows:
Converting Files for Final Cut Pro

(3) To convert your video files, drag them to the designated window on the LEFT side of the screen.

(4) If you wish to change the destination of your new files to a different folder than where the original files reside, click the CHOOSE button next to DESTINATION on the UPPER RIGHT CORNER.

(5) Once you are ready, click SUBMIT. This will convert your files.
